

## Emergence, Complexity & Organization 2008 Annual

Organizations of all kinds struggle to understand, adapt, respond and manipulate changing conditions in their internal and external environments. Approaches based on the causal, linear logic of mechanistic sciences and engineering continue to play an important role, given peoples ability to create order. But such approaches are valid only within carefully circumscribed boundaries. They become counterproductive when the same organizations display the highly reflexive, context-dependent, dynamic nature of systems in which agents learn and adapt and new patterns emerge. The rapidly expanding discussion about complex systems offers important contributions to the integration of diverse perspectives and ultimately new insights into organizational effectiveness. There is increasing interest in complexity in mainstream business education, as well as in specialist business disciplines such as knowledge management. Real world systems cant be completely designed, controlled, understood or predicted, even by the so-called sciences of complexity, but they can be more effective when understood as complex systems. While many scientific disciplines explore complexity principally through abstract mathematical models and simulations, *Emergence: Complexity & Organization* explores the emerging understanding of human systems from both the hard quantitative sciences and the soft qualitative perspectives. This 2008 Annual includes articles from Stephen J. Guastello, Ken Baskin, Mihnea Moldoveanu, Frank Boons, Duncan A. Robertson, Brenda L. Massetti, Maria May Seitanidi, Mary Lee Rhodes and many more, which explore a range of complexity-related topics from philosophical concerns through to the practical application of complexity ideas, concepts and frameworks in human organizations. Also included are a series of

four reproductions of classical papers in the fields of complexity and systems, each with critical introductions that explore their modern relevance: The Meanings of Emergence and Its Modes by Arthur O. Lovejoy (originally published in 1927) An Outline of General System Theory by Ludwig von Bertalanffy (originally published in 1950) Society as a Complex Adaptive System by Walter Buckley (originally published in 1968) Is Adaptability Enough? by Geoffrey Vickers (originally published in 1959)
