

Synthesizing Data from Electrical Logging: Support Decision Making in Manufacturing Facilities

As global economic competition and cooperation become more and more drastic, the electricity demand and price for all the countries increase. Energy saving for enterprise's facilities becomes more important than ever before, especially for small and medium facilities. Energy evaluation technology had been significantly advancing in the past years, but due to some constraints to the small and medium scale industries, their energy consumption evaluation remains unknown to much of the industries today. The work being proposed here would be to create a computer software program to allow the data from data loggers to be more implemented and operated properly based on the information provided by the data loggers. The software would allow the user to observe electric consumption that would be available upon the data downloaded from the data loggers. This book outlines how data in the data loggers is being used to report all the electric consumption information.
